derivatives or fragments. Protein kinase (PkC) is a key enzyme in signal transduction involved in a variety of cellular functions including cell growth, regulation of gene expression and ion channel activity. The coll growth, regulation of different PKC isozymes to different areas of the cell in turn appears due to binding of the activated isozymes to the specific anchoring molecules (RACKs). Peptides that miller either the PKC-binding site on RACKs or the RACK binding site on PKC are isozyme specific anchoring molecules (RACKs). Peptides that miller either the PKC-binding site on RACKs or the RACK binding site on PKC are isozyme specific cranslocation inhibiting translocation or function of deltapkC. The deltapkC agonists or antagonists are useful in activating or inhibiting translocation or function of deltapkC. The deltapkC agonists or antagonists are useful in reducing, enhancing or protecting against damage to cells or tissues due to ischaemic or hypoxic event caused by stroke. Acute administration of the peptides, conjugated to a carrier peptide or a Tat-derived peptide, protected hearts against ischaemic damage as shown by decreased release of creatine kinase. The data indicate that in an intact heart, inhibition of deltapkC conferred greater than 50% protection against ischaemic damage. The sequence presented is human annexin V, which contains a delta RACK binding site.

                                                                                                                               Annexin V, which has high affinity for active thrombocytes, is used as a carritar molecule to build a thrombus-tragething thrombolytic fusion protein. The protein (this sequence) is the result of expression of a fusion gene comprising the Annexin V gene and a low-molecular urokinase gene, in insect cells. The Annexin V-scu-pa.32 fusion protein, expressed in insect cell strain Th-5B1-4, has high affinity for active thrombocytes and has the fibrinolytic activity of urokinase.

                                                                                                                                                                 indicating that PAP-I is probably not constitutively secreted.

The Met residue is removed at in a post-translational event and the newly formed NH2-terminal Ala residue is blocked by acetylation. It binds to phospholipid and inhibits phopholipase A2. The protein can substitute heparin or other anticoagulants in the treatment of dissemnated intravaccular coagulation, deep vein thrombosis, or other disorders. It also has antiinflammatory
                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                 The sequence given is the amino acid sequence of CPB-I. CPB-I was used within a method which involved adding basic amino acids to it which resulted in its stabilisation. This lead to the production of CPB-I which keeps its activity when it is frozen, molten or has been
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Calphobindin I; CPB-I; Protein kinase C; PKC; inhibition; tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9 AQVLRGTVTDFPGFDERADAETLRKAMKGLGTDEESILTLLTSRSNAQRQEISAAFKTLF
                                                                                                                                                                                                                                                                                     The invention relates to eye drops contain CPB-1 (anexin V) and a polyhydric alcohol having a carbonyl value of not more than 5micro Mol. 4g. The eyes drops are for treating e.g. corneal diseases. Such eye drops are without unpleasant irritation upon dropping but wi satisfactory long-term storage stability. The present sequence is the human CPB-1 (calcium/phospholipid binding) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                  Eye drops for treating e.g. corneal diseases, contain CPB-I and polyhydric alcohol with specific carbonyl value, without unpleasant irritation upon dropping but with satisfactory long-term storability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Grandon.

Cycomment: Annexin V has been proposed to play a role in the inhibition of blood coag olipid-binding rather than proteolytic inactivation. It does not affect thrombin-depe cysuperfanily: annexin I; annexin proteolytic inactivation. It does not affect thrombin-depe cysuperfanily: annexin I; annexin proteoly cycle with the cycle of setting bredicted cycle of setting predicted cycle of setting predicted cycle on endonexin fold status predicted cycle on endonexin fold status predicted cycle on endonexin fold status predicted cycle on endonexin repeat homology caxis

F;100-116/Region: endonexin fold status predicted cycle on endonexin conclum, high affinity (Met, Glu, Gly, Glu) status predicted cycle on phosphate (Thr) (covalent) status predicted cycle on the cycle of the cycle
